Capacity of oxidative phosphorylation in human skeletal muscle New perspectives of mitochondrial physiology

ARTICLE INFO

Maximal ADP-stimulated mitochondrial respiration depends on convergent electron flow through Co plexes I + II to the Q-junction of the electron transport system (ETS). In most studies of respiratory contro in mitochondrial preparations, however, respiration is limited artificially by supplying substrates for elec-tron input through either Complex I or II. High-resolution respirometry with minimal amounts of tissue iopsy (1–3 mg wet weight of permeabilized muscle fibres per assay) provides a routine approach fo multiple substrate-uncoupler-inhibitor titrations. Under physiological conditions, maximal respirator capacity is obtained with glutamate + malate + succinate, reconstituting the operation of the tricarboxyli acid cycle and preventing depletion of key metabolites from the mitochondrial matrix. In human skel tal muscle, conventional assays with pyruvate+malate or glutamate+malate yield submaximal oxyg luxes at 0.50-0.75 of capacity of oxidative phosphorylation (OXPHOS). Best estimates of muscul OXPHOS capacity at 37°C (pmol 0₂ s⁻¹ mg⁻¹ wet weight) with isolated mitochondria or permeabilized fibres, suggest a range of 100–150 and up to 180 in healthy humans with normal body mass index and top endurance athletes, but reduction to 60–120 in overweight healthy adults with predominantly seden tary life style. The apparent ETS excess capacity (uncoupled respiration) over ADP-stimulated OXPHO: capacity is high in skeletal muscle of active and sedentary humans, but absent in mouse skeletal muscle uch differences of mitochondrial quality in skeletal muscle are unexpected and cannot be explaine at present. A comparative database of mitochondrial physiology may provide the key for understand ing the functional implications of mitochondrial diversity from mouse to man, and evaluation of altere nitochondrial respiratory control patterns in health and disease.

→ Proposal for a state-of-the-art literature review

- Leader of the project: Paul Coen
- Topic: human skeletal muscle mitochondrial function
- Cf. revue from Erich (2009) \rightarrow extensive literature since the last ten years
- Of interest for further researchers but...
 - ➤ **Definition of "quality control criteria"** for data to be included in the review (or distinction of data according on whether the data meets these inclusion criteria or not)
- To be included (or additional paper(s))
 - \triangleright Description of protocols (that include quality controls: Cyt c, O_2 , T° ...) according to objectives of the study
 - Cultured muscle cells (myoblast, myotubes)
 Leader of this chapter (or paper): Arild Rustan
- Targeted journal "Physiological review" (contact the editor)

Carolina Doerrier Larsen Steen

Summary of the discussion about ...

→ different types of media

How to get robust conclusion since other factors may influence results?

→ Proposal for two joint experiments

- 1. with experts in the field of *human skeletal muscle*
 - > In Denmark
- 2. with experts in the field of *mouse skeletal muscle*
 - > In Innsbruck

NB:

+ researchers from Inclusiveness Target Countries

Date: after April 2018 (2nd grant period)

Summary of the discussion about ...

→ MitoEAGLE WG2 pilot study

Aim: Implementation of a reference protocol as a tool for instrumental and technical quality control in muscle tissues

→ Collection of data (Permeabilized fibers (pfi) - soleus)

Mouse model

- Mouse strain: C57BL6 J Age: 14-20 weeks
- Gender: male (N=4) and female (N=4), total N=8
- SUIT protocol: 1PM;2D;2c;3G;4S;5U;6Ama

→ Quick analysis of data

- Variability among groups (Flux)
- > Same FRC

→ How to improve the protocol to reduce the variability?

- Additional labs
- > Factors: Ww, mechanical permeabilisation (video, picture)
- > Supply of chemicals to participating labs

Summary of the discussion about ...

- → cardiac muscle respirometry data in MitoEAGLE format
- → Search of the literature
 - > Data according to different diseases
 - ➤ Several studies in clinical journals: often lack of robust description of the methodology
 - ➤ Probably not one paper to be written but several ones according to the condition and preparations
- → Working team extended
